Meeting records  Transcript  Recording

Summary

Max Wilberding and Adam Zimmerman discussed the initial dashboard concept, agreeing on "engagement" and "distribution" tabs, with Adam Zimmerman detailing that the "distribution" section requires three distinct groupings:

- **store visitation driven by media,**
- **media buy metrics** (impressions, clicks, click-through rate), and
- **traffic share shift based on gross foot traffic data**

Cost Per Visit is the most critical metric. Participants including Bill Klingensmith also discussed the need for visitation reporting to include competitor cross-traffic data broken down by previous visits and emphasized the crucial new feature of attaching specific media creative (GIF, JPEG, or MP4) to the media buy data for AB testing and correlation analysis, requiring a new step in the production workflow. Max Wilberding, Bill Klingensmith, and Amelia Green agreed that Amelia Green would look for the raw traffic share data used for Wind Dixie and Northgate Market reports and provide information on the data provider so Max Wilberding and Bill Klingensmith can start building mockups and understand the data structure.

Details

- **Initial Tab Structure and Data Requirements:** Max Wilberding discussed the initial concept for dashboard tabs, suggesting "engagement" and "paid media" tabs, though Adam Zimmerman clarified the "paid media" tab should be called "distribution" to align with existing section names. Adam Zimmerman also noted that a third tab for retail media might be needed in the future, but not for the current phase ([00:00:00](#)). Max Wilberding emphasized the need to receive data specifications from the media partner, including where the data will live and how it will interact with existing data, ideally before the end of the month, and Adam Zimmerman agreed to set up a meeting to obtain that information ([00:01:21](#)).
- **Distribution Section Groupings:** Adam Zimmerman outlined that the "distribution" section should be grouped into three distinct areas, rather than just being a single list ([00:02:50](#)). These three groupings are: store visitation driven by media ads, metrics related to the media buy itself (impressions, click-through rate), and traffic share shift, which measures how traffic changes across different stores

(00:03:52). Adam Zimmerman noted that the first grouping, visitation, is the most complicated due to the number of metrics involved (00:04:54).

- **Key Visitation Metrics and Breakdown:** The most critical metric for visitation is Cost Per Visit, which should be prioritized and displayed first. Visitation data includes gross visits, broken down into three categories based on previous visits in the last 30 days: zero previous visits, one to three previous visits, and four plus previous visits (00:04:54). This grouping provides insight into the type of customer visits being driven, but participants agreed to avoid using the misleading term "new visits" (00:08:41).
- **Cross Traffic and Competitive Crossover Reporting:** Visitation reporting must include cross-traffic reporting to show where else the customers driven by media are shopping, with data being broken down by competitor. Furthermore, each competitor's traffic must be further broken down into the three categories of previous visits (zero, one to three, and four plus) to understand the nature of the visits received from competitor traffic (00:05:48). A key feature is the ability to visualize this competitive crossover and other metrics over time to understand increases or decreases in traffic share (00:06:53).
- **Media Buy Metrics and Creative Attachment:** The media buy section requires only three core data points: impressions, clicks, and click-through rate, the latter being a calculation of the first two (00:09:37). A crucial new feature is the ability to upload the specific media creative (typically an animated GIF, but also static files like JPEG or rich video files like MP4) that was used during a given time frame. This attachment allows retailers to correlate high click-through rates with specific creative elements and is important for AB testing (00:10:46) (00:14:31).
- **Creative Upload Process and Logistics:** Bill Klingensmith sought clarification that the media creative would be associated with a specific timeframe, like a week, and Adam Zimmerman confirmed the creative (the ad, or "clickbait") is not the circular, but the advertisement that drove the impressions and clicks (00:12:40). This process will require a new step in the production workflow for the media creative team to upload the content, specifying the retailer and date range, which sounds like a bulk process (00:16:22). The system must also accommodate AB testing, allowing for different creatives to be associated with different groups of stores for the same period (00:14:31).
- **Traffic Share and Gross Visitation Data:** The third section is "traffic share," which uses gross foot traffic data for both client stores and competitor stores to measure changes in traffic share over time (00:17:12) (00:24:28). This requires ingesting a feed (ideally daily) of total visits for every store (00:28:19). This data is crucial because comparing the client's traffic against all competitors combined can show if the client is literally gaining traffic share or just experiencing a general market lift (00:23:01).
- **Importance of Granular Store-Level Data:** The traffic share data is most valuable when broken down to the store level, showing the specific competitor stores that are driving traffic for a client's specific location (00:20:06). Retailers also want to be able to look at store groupings (e.g., "red," "amber," "green" stores) and view comparative charts over time, especially for larger retailers (00:22:06). The raw gross visitation number is the foundation for all these reports (00:27:18).
- **Request for Raw Data and Next Steps:** Max Wilberding and Bill Klingensmith requested the raw data used to generate the current traffic share reports for Wind Dixie and Northgate Market to start building mockups and understand the data structure (00:27:18) (00:29:54). Amelia Green confirmed they would look for the data, noting that the existing reports came from a presentation, and agreed to include

information about the data provider. Max Wilberding stressed that if Amelia Green cannot find the raw data, they need to inform Adam Zimmerman so they can obtain it for development ([00:28:19](#)) ([00:29:54](#)).

Suggested next steps

- ☐ Adam Zimmerman will set up a meeting to discuss all the data they are going to be getting from the media partner and how it is going to be coming to them before the end of the month.
- ☐ Amelia Green will send Max Wilberding and Bill Klingensmith the raw data used to generate the market share reporting from Elise for Windixie's 20-store pilot program, or let Adam Zimmerman know if it cannot be found.

Discuss Analytics Dashboard - 2.0 - Transcript

00:00:00

Max Wilberding: So based off the information that we'd received, what is this more than a year ago? Um around visitation in the paid media. So I had mocked this stuff up. This is prior to Bill's stuff. So this would need to go through that process, too. But essentially, we would have a tab of some sort. We'd have an engagement tab. Then we'd have a paid media tab. Not all clients would have a paid media tab. It would depend on if they have paid

Adam Zimmerman: Yeah, we're going to call the tab distribution.

Max Wilberding: media.

Adam Zimmerman: If you remember, we have these two sections. One is called engagement and one is called distribution.

Bill Klingensmith: Got

Max Wilberding: Okay.

Bill Klingensmith: it.

Max Wilberding: Um,

Adam Zimmerman: And I have an overall one as well.

Max Wilberding: so

Adam Zimmerman: Of course, I see I can see that there. Uh there could be a third tab for retail media like I in the future. Um but but I don't think we have to worry about that for this phase.

00:01:21

Max Wilberding: Okay. Um, so we kind of we'll need to know all the data that we're going to be getting and how it's going to be coming to us um from

Bill Klingensmith: Yep.

Max Wilberding: the media partner um sooner than later like before the end of the month so that we can start planning on where that data is going to live and how uh it'll interact with the rest of our data.

Adam Zimmerman: Okay, I can set that meeting up.

Max Wilberding: Okay. Um, so we would have cost per visit. Um, yes. Clickthrough rate,

Adam Zimmerman: Yeah.

Max Wilberding: visitation by store with some breaks based on how often they're going. We'll need to establish what those are.

Adam Zimmerman: Heat.

Max Wilberding: um visitors who also visit other retailers. This would be for a specific week, but then we could also look at it over time. Um so we could see visitation frequency over time as well as competitive crossover. So we could see any one of these retailers how that compares over time and then visitation frequency breaking that down by store.

00:02:50

Max Wilberding: So we would also these are examples of uh different breakdowns. We would have this essentially for all this data. So cost per visit by store, clickthrough rate by store, um visitation by store, visitors who also visited X by store. Is that all correct?

Adam Zimmerman: Yes. Yes. Let me walk through this from a high level. I think it might help. So we have, let's just talk about really high level. We have our engagement and we have our distribution. Engagement, I think we all are, we're marching down that road and, you know, it's going to go live in June and everyone's so excited about it and all of that. Distribution is what we're talking about. Now, distribution should be divided into a couple of different sections. I'm not saying that they should be actual tabs or anything. I just want to kind of talk about how these things are grouped. Um because what we don't want is something like I see cost per visit and then right underneath it I see click-through rate.

00:03:52

Adam Zimmerman: Um because these are just two very different things that should be in different sections or or groupings. One of the sections has to do with the let's call it visitation store visitation and it's store visitation that's really driven from the media by ad. So it's it's visits that we're driving right and there's a whole bunch of stuff inside of that. I'll talk about that. There's another section that has to do with um with the um excuse me um the media buy specifically. So we're talking about the impressions and the and the click-through rate, you know, the engagement on the media itself. Um and I'll talk about that in more detail. And then there's a a third section that we don't report at all on right now, and that is uh around the way that really it's the traffic share shift, right? So you think of it as market share shift, but it's really not market share, it's traffic share. It's it's us being able to measure and I'm I'll talk about that as well. So let's start with the first piece, the visitation.

00:04:54

Adam Zimmerman: Visitation is the most complicated because it has the most things inside of it. But of course, what do we have? The most important number there is cost per visit. In fact, the most important number in this whole thing we're talking about is really cost per visit is what we put for first and foremost. It should be the first thing they see. It is it's the big thing. Cost per visit is the most important. Um, but where does it come from, right? Of course, we have gross visits, right? So, there's a there's a number of gross visits that are driven to the system that is then broke it down into those three categories, right? The how many of those visits had uh zero previous visits in the last 30 days and one to three previous and four plus. Um um so that's like you know that's that's how many visits and what kinds of visits they are and just generally it's like new versus regular customers but it's those three categories and we don't call them new and regular we call them zero previous one to three and four plus.

00:05:48

Adam Zimmerman: Of course there's a cost per visit that comes out of that. Um there is the um the what we call historically the um the cross traffic report. That's kind of what you're showing on the right hand side here, which is what percentage is coming from different retailers. Really, what it is is just so we're all on the same page of the traffic we are driving. Where else are those people shopping? That's really what it is. It's not like we're stealing customers from one person. It's it's it's allowing them to understand where they're shopping. Um and so of course you have you know X% from you know competitor A and competitor B and competitor C and all of that but then each of those groups is broken down even farther because you have the ability to understand okay the traffic we got from competitor A from Walmart that's the top of your list here you know that's broken into those um those three groups as far as of the of the traffic we got of this 21% we got from Walmart how much of those visits were um were was it the first time that customer came to our store in the last 30 days?

00:06:53

Adam Zimmerman: How many times was one to three and how many times was four plus. So it's it's a way of seeing inside of that. Um there's another level and this is one of the most important things that I think we will do with this um new system that we cannot do today and that's the allowing allowing them to see that change over time. And so if you think about it, it's helpful to see um how much traffic. So let's just pretend I have one store to make this all easy. And of course everything we're talking about is is aggregated for all my stores and I can drill down into any individual store and see all the same data I'm talking about. Change over time to this. Yes, this is exactly it. And then I like I like the way this is actually shown. This is a beautiful representation visually for this. Um but there you go. This is this is uh my so this is competitor crossover and food for less is the competitor in this case right?

00:07:48

Adam Zimmerman: So my store is whatever playground and food for less is the competitor and you can see over the last month you know 12 months or whatever I want to put whatever date range I want to put in what percentage of my traffic is kind of also shopping there and this this is really important because is it is it increasing or is it decreasing and um and how what can I learn from that? It's it's it's one thing that all of our retailers wish they could have and can't have. And there's no really good way for Amelia's team to do this without giving them like a silly amount of reporting, most of which would be somewhat useless. Um, so they need to be able to for for all of this stuff in this case in general, choose a date range um and you know, see all the data or see just one specific store like you're kind of showing here. You're highlighting Food for Less. Um, I'm guessing you could show all and it could kind of walk, you know, it could do this, you know, weird thing with all, but this is a really important piece.

00:08:41

Adam Zimmerman: So, those things are all the things that are involved in visitation. I don't think I'm missing anything. We we we today we we have a thing in Amelia's group that's that says new visits and it h it basically just is a you know you're taking the percentage of of zero previous visits and you're multiplying that by how many gross visits there were and we put it in a group called new visits. It's not it's it's misleading to call it new visits so we don't want to call it that. Um, but it's how many customers are um, you know, how those are the most valuable customers of course to the retailer, people who, you know, if they hadn't been there in 30 days, they saw our ad and then they showed up. We probably did drive them, right? We can't take as much credit for the other two categories, but for that category, we can take a lot of credit and we do generally drive about 25% or so of the traffic that falls into that group, which is which is great.

00:09:37

Adam Zimmerman: Um, so it's a number that we probably want to show somewhere and we want probably want to show how that changes over time, but but we don't want to call we don't want the word new to be used there. Um, we need to think of something else from a semantic standpoint. Um, and then of course changes over time to all of these different things is is an important piece to show as well. cost per visit over time and um you know traffic over time my my my four plus my one to three my zero you know how is that traffic overtime changing that could look similar to what that other chart that you just showed that's probably what you have there on page four actually what is page four yeah that's exactly what you have yeah this is helpful that's that's and I like the way that that's kind of broken out um so I want to talk about the next thing unless you guys have questions on this one any questions question on this one. Okay, so now let's talk about basically it's the media side of this world which is we only really have two data points and those would be impressions and and clicks and of course the third would be click-through rate which is just a mathematical calculation between impressions and clicks.

00:10:46

Adam Zimmerman: Um, the other piece that's very important that we do not do now is that we want to be able to upload the creative, the media creative that was used. And and you know, if this becomes a big blocker, we could launch without this and then put it in later. But it's an important piece of this puzzle. Um because one of the things we do not do now that we want to be able to do is to say, "Oh my gosh, that week I got such a high clickthrough rate. Why?" Well, the first thing they want to do is they want to look at the ad. They want to look at like that animated gift really is what they want to look at. And they want to see what was it about that week. Oh my gosh, I had t-bone steaks. Okay, maybe that's it. Or we had a picture of whatever. It doesn't matter what it is. That's what they want to know. they they're they never have a good answer to why one week does well and another week does poorly.

00:11:38

Adam Zimmerman: The generally the answer is going to be around that media. There's other things that can affect it of course like the Super Bowl or you know presidential election or Christmas but otherwise the most common factor leading to that is is creative. So, um, so a lot of our retailers want to do that. And so, somehow we need to be able to find a way to like attach a GIF basically, uh, to a data point from the past. um and make it easy for our team, you know, with the media creative team when they're uploading content to the media provider to also like put it somewhere labeled the right way so that like it can be accessible here. Um most of the time this is an animated GIF. Uh sometimes it could be a static file, so you could imagine it could be a JPEG or a PNG. Um but we're starting to do some stuff with rich video. So, we're going to want video to be a a plat, you know, we're going to want to be able to upload like an MP4 file or, you know, whatever format they use.

00:12:40

Adam Zimmerman: Um, and have that be usable as

Bill Klingensmith: Okay. So that sounds like it's broken out by weak,

Adam Zimmerman: well.

Bill Klingensmith: right? So it's like identifying that circular. Is that correct interpretation? because that's what we're kind of like all all of our world right now is kind of defined by the circular week. So this data that's coming in, we could break it down by week, by two weeks, by 15 weeks or a year. Um is that the way that this is going to be just as we're doing it with the other ones? And then the other part with the media is that media there's going to be that uh for that week you're putting out paid media that will then be associated to that week entity and you get to see it here. Right.

Adam Zimmerman: Yeah.

Bill Klingensmith: And then the third thing that you mentioned was the video or GIF. And that is that is the same thing that Aaron is talking about with exporting the scrolling. Is that true?

00:13:47

Bill Klingensmith: Is that what you want to see? You want to see the scroll through of the entire

Adam Zimmerman: No,

Bill Klingensmith: circular

Adam Zimmerman: no, no, no. When I'm saying the word media creative, I'm talking about the ad that you'd see in, you know, in in YouTube or uh on the Weather Channel or in the local news.

Bill Klingensmith: Okay.

Adam Zimmerman: It's it's a it's the it's the traffic.

Bill Klingensmith: Okay.

Adam Zimmerman: It's what Tammy over at um MDI calls

Bill Klingensmith: Yeah,

Adam Zimmerman: clickbait.

Bill Klingensmith: it's true. Okay, now I understand. So, it's not it's no longer a static image. It's a it's a

revolving image. So,

Adam Zimmerman: Yeah.

Bill Klingensmith: whatever that whatever that

Adam Zimmerman: It could be static, but it's it's it's an animation usually.

Bill Klingensmith: Yeah,

Adam Zimmerman: It's just an animated gift usually. And it is not the circular.

Bill Klingensmith: I understand what it is now.

Adam Zimmerman: It is the creator that drove because because impressions and clicks and click-through rate are all around that, right?

00:14:31

Bill Klingensmith: I understand.

Adam Zimmerman: That's what people click on to drive to the circular. And so they're going to use it to say like you could like Wind Dixie is a good example of a retailer that would really dive in deep to that data and they would they would want to learn like when do we have better click-through rates and and what's the creative behind that and and and and they want to do AB testing,

Bill Klingensmith: All

Adam Zimmerman: right? They want to some weeks they want to have more than one creative because because I had um you know I had this ad for these stores and this ad for these stores and one was blue and one was red. Which one do people click on more? And so that ability to see that AB testing similar to how we're AB testing over in the engagement

Bill Klingensmith: right.

Adam Zimmerman: side. We want to be able to kind of see on this side because there's just so much value in them being able to to attach the creative to the impressions and clicks and clickthrough rate and learn from

00:15:24

Bill Klingensmith: Right. Okay. And the and the identifier is the URL that you're sending out.

Adam Zimmerman: it.

Bill Klingensmith: So the that particular piece of media clickbait has a specific URL and it could be a group that all of them have

Adam Zimmerman: It's a good question.

Bill Klingensmith: that.

Adam Zimmerman: Uh so let's say there's 10 stores in the in the chain.

Bill Klingensmith: Yep.

Adam Zimmerman: We have 10 campaigns running and there's 10 URLs being used, but most of the time it's just one piece of creative. So the URL is not as relevant in this case as uh the knowledge that you know John on our team made a piece of creative for all 10 stores for this week. And um but we want to be able to accommodate for and I know this is this is not simple. You know John on our team made two pieces of creative one for these five stores and the other for these five stores for this 10 store chain and we kind of ran an AB test. This is the place they'd come to see the results of that test.

00:16:22

Adam Zimmerman: Right.

Bill Klingensmith: Good. Yeah,

Adam Zimmerman: They

Bill Klingensmith: I was just thinking about the first part of it like how do you associate it to that entity for

Adam Zimmerman: Yeah.

Bill Klingensmith: the context. Okay, good. No, that's that's enough. Thank

Adam Zimmerman: similar to similar to lots of other things in our world that that data has to fall to a certain

Bill Klingensmith: you.

Adam Zimmerman: range because and someone's going to have to tell it that and it's going to have to be able to be somewhat flexible when our team there's a step at the end of the production process for our team that works on media creative and typia house right in the future after you

Bill Klingensmith: Yeah.

Adam Zimmerman: guys finish this they're going to have to do another thing and they're going to have to upload it to some tool here And they're gonna have to clarify,

Bill Klingensmith: Yeah.

Adam Zimmerman: of course, which retailer it's for and what's the date range

Bill Klingensmith: Yeah. This actually Yeah,

Adam Zimmerman: because

Bill Klingensmith: this is starting to sound a lot like another bulk process just to really get it to to do its thing.

00:17:12

Bill Klingensmith: Okay, fair enough. No, those are good good things.

Adam Zimmerman: Okay,

Bill Klingensmith: Thank you. That's

Adam Zimmerman: that's two. I three and three is new to us. So, we talked about the visitation world,

Bill Klingensmith: good.

Adam Zimmerman: we talked about the media world and the third one is what I call um traffic share, right? And so this is like measuring market share, but it's it's not market share, it's traffic share. So think about it like this. We see a lot of visitation in and out of stores. We're watching all these devices move in and out of stores. This store, our store, and then competitor A and competitor B and competitor C. We only record a visit when that that visit to that store was preceded by a media impression. Right? So you can imagine that the number of visits that we report are a small fraction of the number of visits that the store receives. Is everyone on that page? Okay. So what if we could receive all visitation from all stores?

00:18:13

Adam Zimmerman: And let's just pretend that the in the data we're getting in is like on a nightly basis, let's

say. And just it could be whatever the cadence is, but let's just say it's every night we get into our database a feed. And let's just use one store as an example. I got one store here, my my our client store, and five competitor stores, which means every night I'm getting six numbers. How many visits came to our store? You know, 832 and then competitor A was 9557 and then 142 and 25 and what whatever. We just have a number. Okay. what we can do now is just a ton of crap behind that. And I'm going to give a couple of examples, but this actually is going to get deeper. And I'm this is the one area because it's new to us. There are some ideas we have floating around about what we're going to pull and how we're going to pull it. And we some of our bigger clients are like having some input into this.

00:19:03

Adam Zimmerman: But I'll give you an example. I want to go in as a retailer and I want to look at how the traffic share has shifted. You know what? Let me show you. I want to show you a report actually. Uh so this will be very helpful. Give me one second. And I have a hard stop in 10 minutes. I know our meeting is 45 minutes but I have a hard stop in 10 minutes. Um give me one second. Can you guys see my screen?

Bill Klingensmith: Yeah.

Adam Zimmerman: Okay.

Bill Klingensmith: Good.

Max Wilberding: Yes.

Bill Klingensmith: Yes.

Adam Zimmerman: All right. So, I'm going to scoot ahead. There's a report here. Uh, by the way, this this this this is the data for all stores, right? And that's that's helpful. This is the this is not what I was talking about, but this is visitation frequency or cross shopping from all stores. I always tell everyone, I want you guys to understand this.

00:20:06

Adam Zimmerman: This is somewhat useless data, right? Because all right, I get that Publix is my bigger competitor and Target is my second big and all this, but this is like across their whole chain. What's going on? It's helpful, but it's they probably know this already. What's really helpful is this data, the store level data. That's my one store with these four competitors and this one store with these six. And even specifically, and I want to get real granular here because this is the data that like is so valuable to them. this Publix here for this one store, store 481. This might be two different Publixes. Amelia knows the difference between this. It might be it's 71% but it might be 41% from one store and 30% from the other. And that we need to be able to show them. And we need to be able to show them when we say Publix, we're talking about two Publixes. One is the Publix at 1781 East River Street and the other is the Publix at 431 North Street.

00:21:05

Adam Zimmerman: That is just being that's so important to them to be able to see this target grocery. Oh, it's that one grocery store over there on High Street or whatever, right? This is like what is it's it's this data is so

valuable for them and understanding the specific store in that specific location and then being able to chart it over time. Like here's what I want to do. I see that um my third largest competitor here is Aldi at 11% for 436. What is this like over the last year? Am I get is my 11% much bigger than it used to be? Is it much smaller than it used to be? And learning from this is when and if this is the Aldi that's right across the street from my store, which I would say I know that it is. I'm thinking to myself, man, I got a problem with some of their main items like milk. Aldi is a good example of this because they have a limited selection of products and they there's a certain products that they have very very low cost for and so for example we might be able to better compete with Aldi if this is growing over time and I'm thinking well this is a problem maybe we literally lower the cost of milk.

00:22:06

Adam Zimmerman: I know that sounds silly but that's the kind of data that they're going to take from this. So I just want that to be clear. It's it's it's really really important. Um, another way of showing data is is this kind of thing where we have different store groupings over time. They have um this is they have their stores as red stores, amber stores, green stores, and there's also other things here, but just think about those three. Um, in fact, I'm going to show you a better example of this. Um, here's just red, amber, and green. And this is over the first I don't know like eight weeks or nine weeks or whatever this program. But this is um this is visitation frequency for zero previous visits. This is visitation frequency for one to three and then for four plus. This is like a different way of kind of showing data than we normally do. Um you can also have data that's shown where this is cost per visit over time with these different groups and in store visits.

00:23:01

Adam Zimmerman: Our bigger retailers are going to want to do this. they're going to want to have like store groups. And then being able to look at charts like this over time is very important for all their stores, but also for individual stores. And then of course for store groupings, like if I own four stores, I just want to see four lines here. But if I own a 100 stores, I don't want to see 100 lines. I want to put them in some sort of groups. Like in this case, they have these colors based on the store health is kind of what that's doing. Um, okay. So now I want to show you um where's the stuff? I want to show you this stuff. Okay, this is this is um visitation uh or or um traffic uh share, right? It's what I was talking about when we did I jumped over into this thing here. And what we have here is Wind Dixie traffic versus all competitors combined, right? And um and so one of the things that's really exciting here is we launched this campaign and and our you know you can see there's a delta between these two that's significant especially if you start week four five what happens here we're really closing that gap like you know and and so the fact that if we just looked at our traffic this red line versus this red line we would think we're killing it right look at all this traffic we're getting but if if the gray lines are increasing at the same rate we didn't really do anything

00:24:28

Adam Zimmerman: we didn't get any more of the traffic from the community because the our competitors got

just as much of a lift. But if the delta between these two is bigger here than it is here, we're literally gaining market share and taking it away from them. And again, market share is the wrong word. Traffic share is what we want to use from a semantic standpoint in this. But there are lots of ways to break this data down. Just understand that at the foundational level, you almost have this like daily input from every one of our stores and every one of our competitor stores of gross foot traffic in through that door. And then from that, we can do all kinds of reporting. This is this is like their their market their traffic share over time. You know, they went from a a 42% to like a 49%. They had this 8% lift. You know, there were 20 stores in this specific test. 15 out of 20 stores outperform their competitors. You know, 8% lift across the board.

00:25:23

Adam Zimmerman: Um, in fact, in here, you can actually see this is for this store, store two 20 726 that this is a bad example for for uh for 381, they were at a 54% market share. Then they went to a 71% market share. So now they increased by 16.87% over the course of this. Right? There were stores that did worse. These stores had a loss. there's a negative 7% market share and negative 11% because you know they went from 55 to 47 34 to 22 but this data is really really important and and again I don't have time to dive into the weeds here but there are other things that that retailers want and what I'll do is I'll work on a list for you of what are the data points that they want to see with this traffic share u thing. Um it's it's one of the areas that has nothing to do really with what we do but has massive value for our retailers. Like our retailers are very very excited about this report.

00:26:21

Adam Zimmerman: It doesn't really say that what we're doing is working or not per se. It can like in that example we literally showed when Dixie that when we launched the campaign we started to close the gap on market share in the stores that that you know we're running in and that is great data for them but they also can just use this for other reasons. you know, Northgate Market is running a a study on their brand um brand affinity, right? So, we can help them understand how much market share they have in each of their 44 stores. And uh so there are some stores where they have this like, you know, 15% market share and other stores where it's like 3%. And so you think to yourself, well, how can we look? What can we learn from where we have more people in that community who shop our stores versus um just other communities where we're clearly not not the primary store for most people who live there. And um and how can we change that? Um and and again, this is just it's data that's very valuable for them.

00:27:18

Adam Zimmerman: It all just comes from this gross visitation number. Um, and then it's doing all kinds of math by just com, you know, is it is it comparing us against all of them? Or maybe I want to do it where I just say, just show me our share compared to just Walmart over the last six months and just show me that just for this one store. Um, and that one Walmart or all Walmarts or you can imagine how you can start to break it down in really interesting ways. There's there's and we can talk we're going to need to talk more about this

because it's new and so they're just ideas that are floating around. Um, but any questions on that one?

Max Wilberding: Can you send the raw data for that?

Adam Zimmerman: Amelia Ken, right? Amelia,

Amelia Green: What do you need? I'm sorry.

Adam Zimmerman: he's looking for the raw data that we use to generate the market share reporting. This is what we got from Elise for Windixie. We have we have similar things for Northgate Market 2. Uh but the best data is just Windixie 20 store in the pilot program.

00:28:19

Adam Zimmerman: you know, you can kind of look at their market share over we it really has been measured since Black Friday all the way through we have the data we have here goes through like I don't know mid or late January something like that.

Amelia Green: I I'll look into it and send it over to you guys.

Bill Klingensmith: Yeah, that creative.

Adam Zimmerman: I don't know how I I think

Amelia Green: I I have a question, Adam.

Bill Klingensmith: Yeah.

Adam Zimmerman: yeah

Amelia Green: Is that something that we're going to get in a regular basis to make it part of the dashboard though or that's going to be something more for the quarterly reviews or

Adam Zimmerman: we're what we're going to get is if not a daily a weekly feed. I hope it would be better if it's daily. I'll kind of explain why, but a feed that is just total visits from our from from each store. You know, in our world, we have many stores. All of our stores and all of our competitor stores. And imagine each of these is a note and each one is just constantly ingesting a a number every day.

00:29:07

Adam Zimmerman: So, all we really have in the database is here's a store. It could be our store, could be a competitor store, and every day what's that number? And then we can do things like show me, show me one day, one week, one month, a whole year, six months, whatever. And we can compare all kinds of things. It's all just based on that gross visitation data. Um, but the value that this has to our clients is extraordinary. What you can imagine it doing, if you know what, um, um, Placer AI does, um, I don't know if either of you familiar with that, um, but it's it's kind of like that. We don't want to be a Placer AI but um there's a lot of data that we can provide that Placer AI can provide that that can uh that is that is that that valuable. So I have to go to another call but Yep.

Bill Klingensmith: All right,

Adam Zimmerman: We

Bill Klingensmith: cool. Yep. Just and a million any of that creative too that he just showed.

00:29:54

Adam Zimmerman: good.

Bill Klingensmith: Anything everything just put it in a folder and share it with us so we have some resources to look

Adam Zimmerman: Amelia I don't think you have the raw data.

Bill Klingensmith: at.

Max Wilberding: We we need to get the raw data in order to start making these mockups and figuring out how the data is going to work.

Bill Klingensmith: Yeah.

Max Wilberding: And

Bill Klingensmith: Okay, cool. Talk to you soon. Thanks, man. All right. You good? I mean, I get it.

Max Wilberding: Yep.

Bill Klingensmith: You know,

Amelia Green: Hi.

Bill Klingensmith: it's fire hose stuff, but uh but that's a really important point. and Ailia, are you following what what Max is asking

Amelia Green: Yeah. Yeah. Um I'm not sure if we have the raw data for that though,

Bill Klingensmith: for?

Amelia Green: Max, because Elise sent over like a presentation now that I'm I'm recalling.

Max Wilberding: Okay.

Amelia Green: And then we repurposed everything she sent in the presentation and put it in one of ours for presenting to the client now that she sent a file with data and we work with it.

00:30:55

Bill Klingensmith: Okay.

Amelia Green: But I'll see if I can find anything cuz that should be coming from everything she sends in visitation on a weekly basis anyway. So I'll look into that and see what I can find and what I can send you guys for reference on what she did.

Bill Klingensmith: All

Max Wilberding: And if you can't find something,

Bill Klingensmith: right.

Max Wilberding: make sure to let Adam know that he needs to get it to

Amelia Green: Yeah, definitely.

Bill Klingensmith: Yeah. in that document that he was just showing too.

Max Wilberding: us.

Bill Klingensmith: So if if that I saw the first one I believe was yours, right, Max? The the And then the second one, Amelia, if that thing that he was just showing last with all those points will be able to align.

Amelia Green: a Wendy one.

Bill Klingensmith: Yeah, that that gray and red one that he just showing.

Amelia Green: I have that. I I I made that. So,

Bill Klingensmith: Yeah, perfect. Yeah,

Amelia Green: yeah.

Bill Klingensmith: any of that stuff because then it'll align with this conversation and then we'll be able to um draw parallels to understand it more.

00:31:49

Bill Klingensmith: I'm still, you know, I get it now a little bit, but I I'm with Max. It's like we need to know what the raw data, you know, the points are. Like it's like is there 10 points that we're we're dealing with or are there hundred or is there it's

Amelia Green: Yeah.

Bill Klingensmith: probably just like eight or 10 or so, but let's uh understand that. And then also any names of any of the providers that you're do getting it from you know I don't know Mac

Amelia Green: This will all be coming just for one provider.

Bill Klingensmith: that's

Amelia Green: I'll I'll include that information in there because she's the only one who provides that information anyway.

Bill Klingensmith: yeah because I mean we we just I mean the real challenge that we get is not having it like an

Amelia Green: So,

Bill Klingensmith: API where we can just talk to it and just let it set up and do it. anytime we have to email a file to Max and Max got to car it to you and then you got to upload it into the system and then that take you it's like anything that we could do that just cuts that out would be absolutely beautiful and this might be something that we if with what the structure is that we create think of it this way too Max it's like we're reverse engineering it if we could hand that back to whomever it might be able to way to get them to um do that for us yeah all right

Amelia Green: Thank you guys.
